Final Project Presentation Guide

CSE0613316 – Software Project Design and Development (Experiment 13)

Format

1. Time per team: 12 minutes of presentation, including a 4-minute live demonstration, followed by about 8 minutes of questions and individual viva.
2. Both members must present and share the slides about equally. Each member must be able to explain any slide, not only their own part.
3. Upload the slides as a PDF to Google Classroom under ‘Experiment 13’ before your presentation. File name: Team<ID>_Exp13.pdf.
4. The deployed product link must be live on the presentation day. Bring a laptop with the project running locally as a backup.

Preparation

1. Prepare your PPT with less content. Avoid paragraphs.
2. Focus on images, diagrams, data, results and key points.
3. Time and number of slides are not important! Give more time to the problem, your solution and the live demonstration.
4. Ensure that there are slide numbers on every slide.
5. Use a light-coloured background and a dark colour for the font.
6. Avoid extra style and animation; keep it simple.
7. Use bullet points, not paragraphs (maximum 8 lines, about 8 words per line).
8. Keep the font size the same on every slide (title at least 28 pt, body at least 20 pt).
9. Diagrams must be readable from the back of the room. Show only the part you are explaining, zoomed in.
10. Show code only when it explains a key idea: at most 10 lines in a large monospaced font.
11. Slide tools (Gamma, Beautiful.ai, Claude) may only format an outline you wrote yourself. Check every claim on the slides and record the tool use in your Tool Usage Log.

Live Demonstration Checklist

1. Demonstrate the deployed product (live URL), not localhost, unless the instructor agrees otherwise.
2. Prepare a demo script: one complete user journey that covers the core features in 3 to 4 minutes.
3. Load realistic demo data and create test accounts beforehand. Never show real passwords or personal data.
4. Check the internet connection, screen resolution and browser zoom before your turn.
5. Keep a backup: a 2 to 3 minute recorded video and screenshots of every important screen in the slides.
6. Do not write or fix code during the demo. If something fails, explain why, switch to the backup and move on.
7. Show the release tag and a passing CI run to prove that the demo is the version you submitted.

Suggestion

1. Storytelling to describe your problem is very effective.
2. Involve the audience in the story.
3. Presentation does not mean reading out the slides.
4. The audience does not read the slides; they focus on the images, data and graphs. So be careful about those.
5. Interaction with the audience with the help of slides is very important. Show some examples or data from the slides.
6. Do not look at the slides very frequently. Just change the slide and describe it in your own words.

Tips

1. During the presentation, do not argue with your teammate. That shows you did not work as a team. If your teammate gives wrong information, let it go. If it is very important, add a few points positively during the Q/A session (for example, "we could also solve this problem in that way").
2. Be confident about yourself. The judges will try to test your understanding with difficult questions.
3. If a judge wants to add a few points or solutions, agree with them and add those to your future work.
4. Each member answers viva questions individually. Expect questions on any part of the code, design or tests, not only your own part.
5. If you do not know an answer, say so honestly and explain how you would find out. Do not guess.
6. Prepare answers to these common questions:
    a. Which tool helped you most, and which helped least? Why?
    b. Defend one architecture or design decision.
    c. Show where one requirement is tested.
    d. Show one bug you found and how you fixed it.
    e. What would you do differently if you started again?

PPT

1. Introduce your project
    a. Project name with logo
    b. University name with logo
    c. Course code, course title and semester
2. Introduce your team
    a. Team members (ID, name, role)
    b. Course instructor (name, designation, Department of CSE, UITS)
    c. You may use a team name or project title at the top (ensure that it is formal and related to this project)
    d. Repository and live product links (a QR code helps the audience)
3. Problem and Motivation
    a. Describe the real-life problem as a short story
    b. Who is affected and how? Give one statistic or real example
4. Objective / Goal
    a. Goal of your project: what do you want to do?

    b. Write 4 to 6 measurable objectives (state the problem with the solution)
    c. You will check each objective again in the Conclusion
5. Related Works / Existing Solutions
    a. Add 2 or 3 existing applications or systems and point out why your project is different
    b. A comparison table (features of existing systems vs. yours) works well
    c. It is very important. It shows that you really know the problem and have studied it.
6. Requirements
    a. Key functional and non-functional requirements
    b. One or two user stories with acceptance criteria (do not show the full SRS)
7. Methodology and Project Plan
    a. SDLC model (Agile / Scrum / Kanban / Spiral); write 3 or 4 points on why you chose it
    b. Timeline or Gantt chart: planned vs. actual
    c. How tasks were tracked (GitHub Issues / Projects)
8. System Architecture and Technology Stack
    a. One clear architecture diagram
    b. Technology used in each layer and why you chose it
9. System Design
    a. Use case diagram
    b. ER diagram, to represent the database
    c. One class or sequence diagram for the key feature
    d. Use 2 or 3 slides only; the rest is in your report
10. Key Design Decisions
    a. 2 or 3 important decisions, the alternatives you considered and why you chose this one (performance, cost, security, team skills)
11. Project Description and Live Demonstration
    a. Tell the audience that you will demonstrate it now (or right after this slide)
    b. Ensure that every important UI is present on the slides as a backup
    c. Use 4 to 6 slides of screenshots that follow the user journey
12. Testing and Quality Assurance
    a. Test levels and tools used
    b. Key numbers: tests passed, code coverage, requirements covered (%)
    c. Defects found and fixed, by severity
    d. One interesting bug: how you found it and how you fixed it
13. Code Review, Security and Ethics
    a. Review and security-scan tools, and the main findings you fixed
    b. How passwords, secrets and personal data are protected
    c. Licences of the main libraries you used
14. CI/CD and Deployment
    a. Pipeline diagram (build, test, deploy)
    b. Hosting environment, release tag and live URL
15. Use of Assistant Tools
    a. Which tools you used in which phase
    b. What you designed yourself first
    c. One example where a tool was wrong and how you caught it

16. Teamwork and Contribution
    a. Who did what (modules, tests, documentation)
    b. Contribution split and a summary of commits and pull requests
    c. Main risks you faced and how you handled them
17. Results and Socio-economic Impact
    a. Which objectives were achieved and which were not
    b. Describe how this project will change our system / society / business
18. Limitation
    a. This part is very important
    b. Mention all of your limitations (do not hide anything)
    c. It will help you during your Q/A session
19. Future work
    a. Mention all of your unfinished work
    b. Think about the audience: what will they ask you to add? Add those to your future work ;)
20. Conclusion
    a. Relate all of your goals to the outcome of your project
21. Reference
    a. Add a few key references: standards, official documentation, books or research papers
    b. Try to avoid ordinary web pages
    c. Use IEEE style, and ensure the same references are in your report
    d. End with a “Thank you / Questions” slide showing the repository and live product links

Evaluation (Rubric 3)

---

1. Product demonstration: 30%
2. Individual understanding (viva): 30%
3. Presentation quality: 20%
4. Defense of design and tool-use decisions: 20%
